September 13, 2012

Outline

Estimation of the absolute losses

Error estimation for Fluka studies

Outline

Estimation of the absolute losses

Error estimation for Fluka studies

Quoted numbers

- Losses in SMH16 estimated by RP: $1\% \pm 0.2\%$
- MTE design report (unbunched case): 1%
- Fluka estimates with realistic beam distribution: 0.55%

Analytical estimation

- Model assuming simple Gaussian beams and septum blade considered as a "black hole"
- Estimates are $0.65\% \pm 0.1\%$

Outline

Estimation of the absolute losses

Error estimation for Fluka studies

Errors on the losses computations

- Dominated by the statistical error due to the sampling of the beam distribution
- At the beginning and end of the bump, only the large amplitude tails of the distribution are interacting with the blade \rightarrow reduces the statistics and increase the relative error \Rightarrow have to increase the number of particles in these distribution (and keep the weight constant)

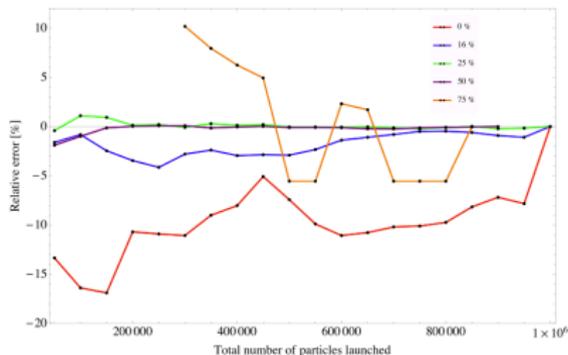

Figure 1: Relative error as a function of number of tracked particles

Conclusions

Coming studies

- Control of the error on the losses
- Losses as a function of time
- Stray radiation maps (SS15 + SS16) for different configurations
- Iterations to optimize the blade position

Thanks !
